## What is a polyfill?

A polyfill, or polyfiller, is a piece of code (or plugin) that provides the technology that you, the developer, expect the browser to provide natively.

Coined by [Remy Sharp](https://remysharp.com/2010/10/08/what-is-a-polyfill) - <https://remysharp.com/2010/10/08/what-is-a-polyfill>

We, as developers, should be able to develop with the HTML5 APIs, and scripts can create the methods and objects that should exist. Developing in this future-proof way means as users upgrade, your code doesn't have to change but users will move to the better, native experience cleanly. From the HTML5 Boilerplate team on polyfills - <https://github.com/Modernizr/Modernizr/wiki/HTML5-Cross-Browser-Polyfills>

## Further research:

<https://en.wikipedia.org/wiki/Polyfill>

## An example polyfill

The code below is a polyfill for the new ES6 String method, `startsWith()` :

```
if (!String.prototype.startsWith) {  
  String.prototype.startsWith = function (searchString, position) {  
    position = position || 0;  
    return this.substr(position, searchString.length) === searchString;  
  };  
}
```

As you can see, a polyfill is just regular JavaScript.

This code is a simple polyfill (check it out on MDN), but there's also a significantly more robust one, [here](#)

### QUIZ QUESTION

Why does the `startsWith()` polyfill begin with the following line?:

```
if (!String.prototype.startsWith)
```

- ☐ Without it, the script would throw an error.
- ☐ It checks to make sure the `String.prototype` exists.
- ☐ It avoids overwriting the native `startsWith` method.
